

Credit Risk AutoML: Data Upload Guidelines

To ensure the machine learning pipeline and macroeconomic layering function correctly, your uploaded .csv file must contain the following standard columns.

Formatting Rules:

- Please ensure dates are formatted cleanly (e.g., YYYY-MM-DD or DD-MM-YYYY).
- Ensure amounts are purely numeric (no commas, spaces, or currency symbols like 'KES' or '\$').

Column Name	Data Type	Required	Description
borrower_id	String / Int	Yes	Unique identifier for the client (e.g., Client ID, hashed ID).
borrower_type	String	Yes	Category of the borrower (e.g., 'Retail', 'SME', 'Corporate').
loan_no	String / Int	Yes	Unique identifier for the specific loan facility.
loan_date	Date	Yes	The origination or disbursement date of the loan. <i>The system uses this to map annual macroeconomic data.</i>
due_date	Date	Yes	The contractual maturity date of the loan.
payoff_date	Date	No	The date the loan was actually fully

			repaid (leave blank if active/defaulted).
tenure_days	Integer	Yes	The total duration of the loan in days.
amount	Numeric	Yes	The principal disbursement amount in your local currency.
default_flag	Integer	Yes	The Target Variable. Must be 1 (Defaulted/NPL) or 0 (Performing). The AutoML model requires this to learn risk patterns.

Pro Tip: You do not need to upload country codes or global macroeconomic data yourself. The application automatically appends sovereign macro-indicators based on the country you select in the upload menu and the loan_date provided.
